**PRACTICAL SUBMISSION RECORD- A.Y. 2024-25**

Title: Create a dataset of ages of 10 students and carry out following functionalities

1. Students average ages
2. Mean of the students
3. Median of the students
4. Students with higher and lower age

Code:

```
import numpy as np
```

```
STUDENT_CNT = 10
```

```
print(f"Enter the age dataset of {STUDENT_CNT} students")
```

```
students = []
```

```
for i in range(STUDENT_CNT):
```

```
    temp = int(input(f"student {i + 1}: "))
```

```
    students.append(temp)
```

```
print(f"1 : Students average age: {np.average(students)}")
```

```
print(f"2 : Students mean age: {np.mean(students)}")
```

```
print(f"3 : Students median age: {np.median(students)}")
```

```
print(f"4.a: Count of Students With highest age {max(students)}: {students.count(max(students))}")
```

```
print(f"4.b: Count of Students With lowest age {min(students)}: {students.count(min(students))}")
```

Output:

```
Enter the age dataset of 10 students
student 1: 20
student 2: 21
student 3: 22
student 4: 23
student 5: 20
student 6: 21
student 7: 21
student 8: 20
student 9: 22
student 10: 23
1 : Students average age: 21.3
2 : Students mean age: 21.3
3 : Students median age: 21.0
4.a: Count of Students With highest age 23: 2
4.b: Count of Students With lowest age 20: 3
```
